# Documentation- AuditPro
# (An interface for Audit Management)

## ***Project Summary:***

### CA Audit Interface- AuditPro

The **AuditPro** is a Python-based stand-alone desktop application developed for **Yogesh Shah** to help manage and organize audit-related work efficiently. The system is designed to assist the CA in handling **audit working papers, client assignments, and user records** in a structured digital format.

This application allows the CA to **upload, review, update, accept, or reject audit working papers** submitted during the audit process. By maintaining all documents digitally, the system helps ensure that the audit documentation is properly reviewed and approved before finalization.

The system also includes a **User Management module**, which allows the CA to maintain records of team members working on different clients. Through this module, it becomes easy to track **which user is assigned to which client and what work they are responsible for**. This improves coordination and helps maintain accountability within the audit team.

The project is developed using **Python with GUI libraries such as Tkinter**, providing a simple and user-friendly interface for managing audit tasks. The system helps reduce manual paperwork, improves organization of audit records, and makes it easier for the CA to monitor the progress of work.

Overall, the **CA Audit Interface developed for Yogesh Shah** provides a centralized platform to **manage working papers, track user assignments, and maintain proper audit documentation**, making the auditing process more efficient and organized.

## ***Project Phases***

- **Phase 1: Requirements Gathering & System Design**

**In this phase, all the requirements of the project are collected from the client CA Yogesh Shah. The purpose of this phase is to understand how the Chartered Accountant manages audit working papers and client records. Discussions are conducted to identify the necessary features such as user management, client management, document approval/rejection, and record tracking. Based on these requirements, the overall system architecture and workflow of the project are designed.**

---

- **Phase 2: Module Planning**

**After understanding the requirements, the system is divided into different modules. Each module is planned with specific functionalities. For example:**

- **User Management Module – to manage users and their access.**
- **Client Management Module – to store and manage client information.**
- **Working Papers Module – to upload, review, accept, or reject audit papers.**
- **Record Management Module – to maintain records of which users are working for which clients.**

  **This phase ensures the system is organized and easy to develop.**

---

- **Phase 3: Dashboard Development**

**In this phase, a central dashboard is developed using GUI (Graphical User Interface). The dashboard acts as the main control panel of the system where the Chartered Accountant can easily view and manage working papers, client records, and user activities. The dashboard provides quick access to different modules and displays important information such as pending papers, approved documents, and user assignments.**

---

- **Phase 4: System Design and Development**

**During this phase, the actual design and development of the system take place. All modules are implemented according to the client's requirements using GUI design and database management techniques. The interface is designed to be simple and user-friendly so that the CA can easily navigate through the system. A database is also created to securely store data such as users, clients, and working papers.**

---

- **Phase 5: Review, Testing, Bug Fixing & Final Deployment**

**In the final phase, the entire system is tested to ensure that all modules are working properly. The system is reviewed to check for errors, bugs, or performance issues. Any problems found are fixed to improve reliability and usability. After successful testing, the final system is deployed for use by CA Yogesh Shah to manage audit working papers and client records efficiently.**

# ***Software Requirement Specification (SRS)***

## 1. Introduction

- **1.1Purpose**

**The purpose of this system is to develop a CA Audit Interface for Yogesh Shah to manage audit working papers, client records, and team assignments digitally. The system will help organize audit documentation, track user responsibilities, and manage the approval or rejection of working papers during the audit process.**

- **1.2 Scope**

**The CA Audit Interface will allow the Chartered Accountant and audit staff to:**

- **Manage audit working papers**
- **Upload, review, accept, or reject documents**
- **Maintain client records**
- **Manage users and their client assignments**

**The system will help reduce paperwork and provide a structured platform for handling audit documentation.**

- **1.3 Definitions**

- **CA – Chartered Accountant responsible for auditing.**
- **Working Papers – Documents and evidence collected during an audit.**
- **User Management – System module used to manage audit team members.**
- **Client – Organization or individual whose financial records are audited.**

---

## 2. Overall Description

- **2.1 Product Perspective**

**The CA Audit Interface is a standalone desktop application built using Python and Tkinter GUI. The system will store audit records, user details, and client assignments in a database.**

- **2.2 Product Functions**

**The system will provide the following major functions:**

1. **User Login System**
2. **User Management**
3. **Client Management**
4. **Working Paper Upload and Management**

5. **Accept / Reject Audit Papers**
6. **Audit Dashboard**

➢ **2.3 User Classes**

The system will include the following types of users:

| User Type | Description |
|---|---|
| CA (Admin) | Full system access, manages users, clients, and approvals |
| Audit Staff | Upload and manage working papers |
| Reviewer | Review and update audit documents |

➢ **2.4 Operating Environment**

- **Programming Language: Python**
- **GUI Framework: Tkinter**
- **Operating System: Windows**
- **Database: SQLite / MySQL**

---

## 3. System Features

➢ **3.1 Login and Authentication**

**The system will provide a secure login system.**

**Functions**

- **User login using username and password**
- **Authentication validation**
- **Role-based access control**

➢ **3.2 User Management**

**The CA can manage audit team members.**

**Functions**

- **Add new user**
- **Edit user details**
- **Delete user**
- **Assign users to specific clients**
- **Maintain record of user responsibilities**

- **3.3 Client Management**

**The CA can maintain client records.**

**Functions**

- **Add new client**
- **Update client information**
- **Assign users to clients**
- **Maintain client audit history**

- **3.4 Working Paper Management**

**The system will manage audit documents.**

**Functions**

- **Upload working papers**
- **View uploaded papers**
- **Edit or update documents**
- **Maintain document records**

- **3.5 Document Review System**

**The CA can review audit papers.**

**Functions**

- **Accept working papers**
- **Reject working papers**
- **Add remarks/comments**
- **Track approval status**

- **3.6 Audit Dashboard**

**The dashboard provides an overview of audit progress.**

**Functions**

- **Display client list**
- **Show pending documents**
- **Display approved and rejected papers**
- **Monitor audit activity**

---

## 4. Non-Functional Requirements

- **4.1 Security**
- **User authentication required**
- **Only authorized users can access documents**
- **Password protection for accounts**
- **4.2 Performance**
- **Fast document loading**
- **Efficient record management**
- **4.3 Usability**
- **Simple and user-friendly interface**
- **Easy navigation for audit staff**
- **4.4 Reliability**
- **Data should be stored securely**
- **Backup mechanism for audit records**

## 5. Project Timeline

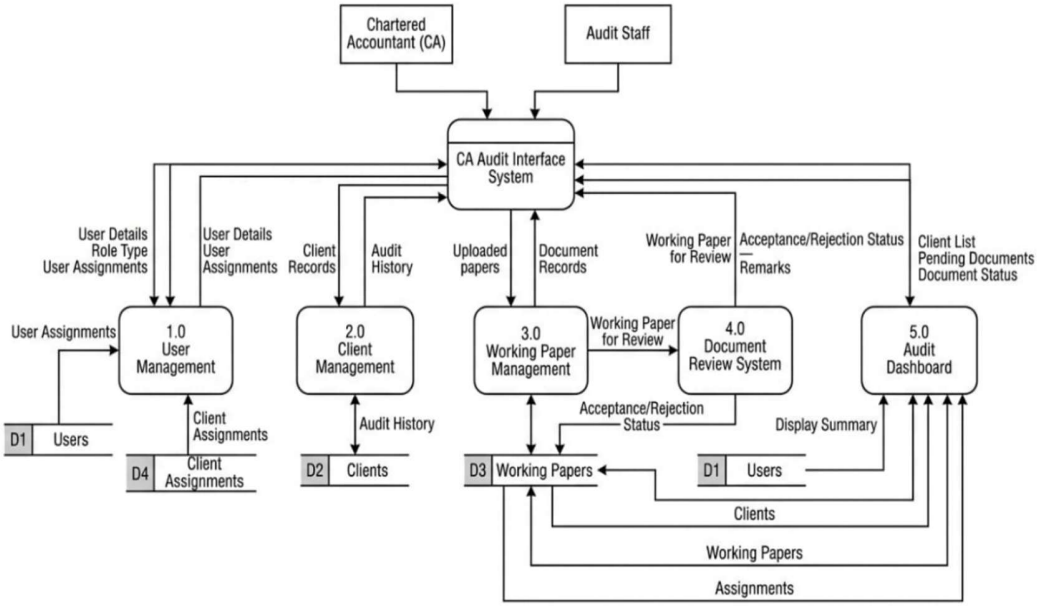
The table below includes the Gantt Chart of the project. The project is divided into 5 phases. Each phase has been dedicated specific timeline. Here "W" indicates Number of weeks.

| Task / Phase | W1 | W2 | W3 | W4 | W5 | W6 | W7 | W8 | W9 | W10 | W11 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Phase 1: Requirements Gathering & System Design | | | | | | | | | | | |
| Phase 2: Module | | | | | | | | | | | |
| Phase 3: Dashboard | | | | | | | | | | | |
| Phase 4: Design | | | | | | | | | | | |
| Phase 5: Reviews & Testing, Bug Fixing & Final Deployment | | | | | | | | | | | |

Note: Colored cells represent the weeks each phase is actively being worked on

## ***DFD (Data Flow Diagram)***

DFD Level-1



## ***Main Overview of each Module***

**Module - Login page**

Username

Password

Username And Password are been Set.

**Module - Dash board**

It will keep the live record of the working projects that how many projects are pending and how many are completed.

**Module 3 - Working Papers**

Here user can add the new working paper, delete the paper if do not want, approve or reject the paper.

**Module 4 – User Management**

Here user will add the user details that, the clients they are working for.

**Module 5 – Database Manager**

Here database of all the client, Username and password, and completed working paper will be stored and updated live here.

## Conclusion

The **AuditPro** has been successfully designed and developed to provide a digital solution for managing audit documentation, user responsibilities, and client records. The system allows efficient management of **audit working papers, client assignments, and user management**, enabling the Chartered Accountant to review, accept, or reject documents and maintain proper audit records in an organized manner.

The developed system has been **reviewed and approved by Yogesh Shah**, confirming that the application meets the required audit workflow needs and can effectively assist in managing audit-related activities in a more systematic and reliable way.
